On the Poisson approximation for visits to balls

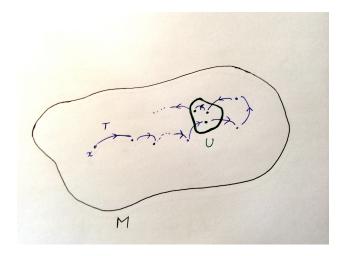

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへぐ

INTRODUCTION

n iterations of $x \in M$ under the map $T:M \circlearrowleft$

The iterates of x visit $U \subset M$

After a long time, how many times did the orbit of x visit U?

E

990

Completing the framework

Missing ingredient: we assume that there is a probability measure μ such that:

 $\mu(T^{-1}A) = \mu(A) \quad \forall A \text{ Borel subset of } M.$

Counting the visits of $x, Tx, \ldots, T^N x$ to U:

$$\sum_{j=0}^N \mathbb{1}_U(T^j x).$$

Question:

$$\mu \Big\{ x : \sum_{j=0}^{N} \mathbb{1}_{U}(T^{j}x) = k \Big\} = ?$$

Natural scale:

$$N \propto \frac{1}{\mu(U)} \cdot$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへぐ

Shrinking targets

Sets U such that $\mu(U) \to 0$ in some sense:

• $U = U_n(y)$: cylinder set of a refined partition about y;

- ロ ト - 4 日 ト - 4 日 ト - 4 日 ト - 4 日 ト - 4 日 ト

- $U = B_r(y)$: ball centered at y with radius r
- • •

What happens in general ?

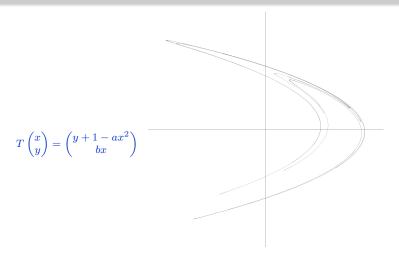

• As Roland will explain us:

"you can get anything you want by contructing a suitable $(U_\ell)_\ell$ such that $\mu(U_\ell) \xrightarrow{\ell \to \infty} 0$ "

• For **balls** and **cylinders** and for "**chaotic**" dynamical systems, the Poisson law is the natural candidate.

The rate of mixing should only show up in the "speed" of convergence towards the Poisson law.

OUR MOTIVATING EXAMPLE: THE HÉNON MAP

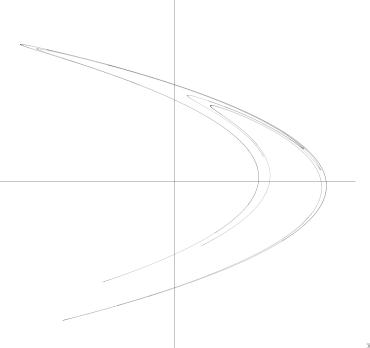

Hénon's attractor

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Target set:

 $U = B_r(y)$

Assumptions

Nonuniformly hyperbolic systems modeled by Young towers such that:

- **①** their return-time function has an exponential tail;
- 2 the local unstable manifolds are one-dimensional.

There exists a natural *T*-invariant probability measure μ (SRB measure) (\Leftarrow the return-time function is integrable).

- ロ ト - 4 回 ト - 4 □

THEOREM (J.-R. C. - P. COLLET, 2012)

There exist constants C, a, b > 0 such that for all $r \in (0, 1)$:

• There exists a set \mathcal{M}_r such that

$$\mu(\mathcal{M}_r) \le Cr^b;$$

• For all $y \notin \mathcal{M}_r$ one has

$$\left| \mu \left\{ x \in M \; \middle| \; \sum_{j=0}^{\lfloor t/\mu(B_r(y)) \rfloor} \mathbb{1}_{B_r(y)}(T^j x) = k \right\} - \frac{t^k}{k!} e^{-t} \right| \le C \ r^a$$

for every integer $k \ge 0$ and for every t > 0.

Remarks

- this is an approximation result;
- it implies an asymptotic Poisson law as $r \to \text{for } \mu\text{-a.e.}$ center y;
- . in fact we control the total variation distance between

$$\sum_{j=0}^{\lfloor t/\mu(B_r(y))\rfloor} \mathbb{1}_{B_r(y)} \circ T^j \quad \text{and} \quad \text{Poisson}(t)$$

for $y \in \mathcal{M}_r$. It is $\leq C r^a$.

• A central diffulty is to deal with measures which are not absolutely continuous.

AN ABSTRACT POISSON APPROXIMATION RESULT

Let $(X_n)_{n \in \mathbb{N}}$ be a stationary $\{0, 1\}$ -valued process and $\varepsilon := \mathbb{P}(X_1 = 1)$. Then for all positive integers p, M, N such that $M \leq N - 1$ and $2 \leq p < N$, one has

 $d_{TV}(X_1 + \dots + X_N, \text{Poisson}(N\varepsilon)) \le R(\varepsilon, N, p, M)$

(日) (日) (日) (日) (日) (日) (日)

The error term $R(\varepsilon, N, p, M)$ is made of three contributions. One of them is a decorrelation term.

One of them concerns "short returns".

The last one is independent of the process $(X_n)_{n \in \mathbb{N}}$.

IDEA OF PROOF

Take a finite time interval and compare the number of times $X_j = 1$ with the number of times $\tilde{X}_j = 1$ where $(\tilde{X}_n)_{n \in \mathbb{N}}$ is a Bernoulli process such that $\mathbb{P}(\tilde{X}_1 = 1) = \varepsilon$.

GENERALIZATIONS

local unstable manifolds with dimension ≥ 2;
 polynomial tail for the return-time function.

Françoise and Benoît (2014) under the assumption

$$\mu(B_{r+r^{\delta}}(x)\backslash B_r(x)) = o(\mu(B_r(x)).$$

for $\delta > 1$ not too large.

Examples covered:

solenoid with intermittency and billiard in stadium.

(with a control of the approximation ?)

Haydn and Wasilewska (2014) obtained a Poisson approximation with an error less than $|\log r|^{-\kappa}$ for $\kappa > 0$ small enough. The tail has to decrease with a degree > 4. They also assume something like (1).

- ロ ト - 4 日 ト - 4 日 ト - 4 日 ト - 4 日 ト - 4 日 ト

Jorge Freitas, Haydn and Nicol (2013) obtained some results for a class of planar billiard maps with polynomial mixing rate (Bunimovich's stadium, flower-like stadia). They have a bound for the error term.

They use inducing.
